CGG Seminar Working Party

Generating Value from the 2011 Census

19 September, 2012

Centre for Advanced Spatial Analysis

Outline

- The Context: A Dramatic Change in Media for Display and Dissemination
- Web 2+ and Online Mapping
- Integrating Diverse Data: Adding Value
- Generating New and Complementary Data: Crowd-Sourcing
- Visual Analytics
- Census Analytics
- Next Steps: What Can We Expect?

Centre for Advanced Spatial Analysis

The Context: A Dramatic Change in Media for Display and Dissemination

From Ollie O'Brien's talk to this group last year, I retrieved the following map of visualising population density in the 1841 UK Population Census.

The map was online at

<http://pressandpolicy.bl.uk/Resource-Library/Augustus-Petermann-s-population-density-map-1841-credit-British-Library-Board-34a.aspx>

And I pulled it up to find that I could download it from the British Library web site. This was a real surprise as I hadn't seen the map before and it illustrates that the web not only allows us to discover the present and the future but the past. I was so taken with the map I downloaded it to my iPad and then my wife took a picture of it and me with my iPhone, I emailed it to myself and then transferred it here to my MacAir

Centre for Advanced Spatial Analysis

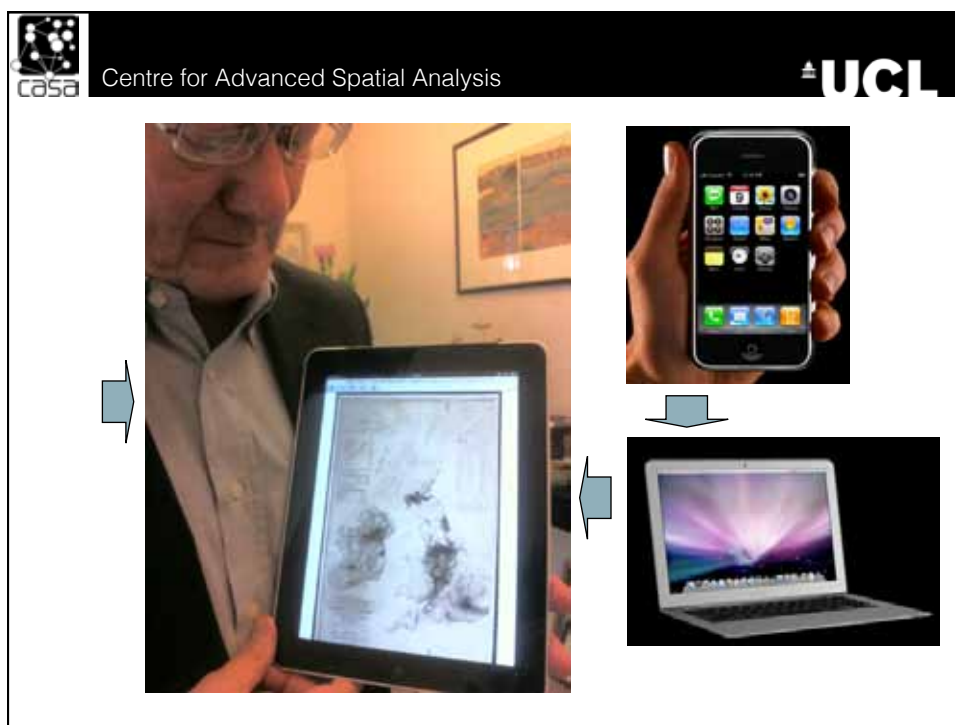

It's great example of the power of the web to disseminate and connect through many devices and media

→

Today

The diagram illustrates a workflow or data flow. It features three main components: a person holding a tablet, a hand holding a smartphone, and a laptop. The person on the left is wearing glasses and a light-colored shirt, holding a tablet that displays a map of the United Kingdom. A blue arrow points from the person towards the smartphone. The smartphone, held by a hand, shows a grid of app icons. A blue arrow points from the smartphone down to the laptop. The laptop, on the right, displays a colorful, abstract image. The entire diagram is set against a black background with the 'casa' logo and 'Centre for Advanced Spatial Analysis' text on the left, and the 'UCL' logo on the right.

To an extent, much if not most of what I will talk about relates to how new technologies are changing the way we are able to display and disseminate.

Web 2 is essentially a medium in which we can interact with data in an online context, consuming and producing new data

Enormous strides are being made in this new world but we do need to exercise a degree of caution. Our science is being changed for sure but it is not clear that it is getting better. Our analytics as we now call them, are not moving as fast as our ability to visualise.

Centre for Advanced Spatial Analysis

I am going to begin with looking at the sorts of maps we can now visualise online and there are many of these sites where one can do this and interact to produce simple analysis and new data

We usually do it on the desktop, but there are various applications to smaller devices such as tablets and phones and doubtless when we get digital paper, we will have yet another medium to enable us to create new ways of interaction.

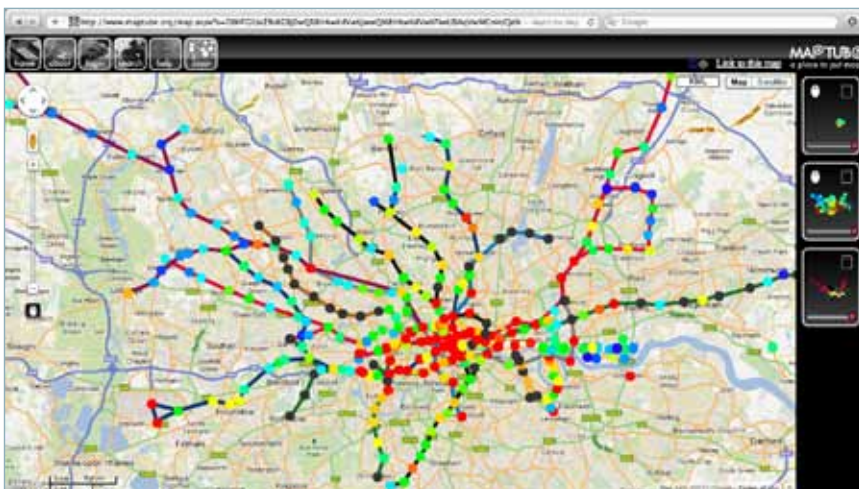

I am going to start by showing you our entry into this world some 5 or 6 years ago when we created our site called Maptube: www.maptube.org

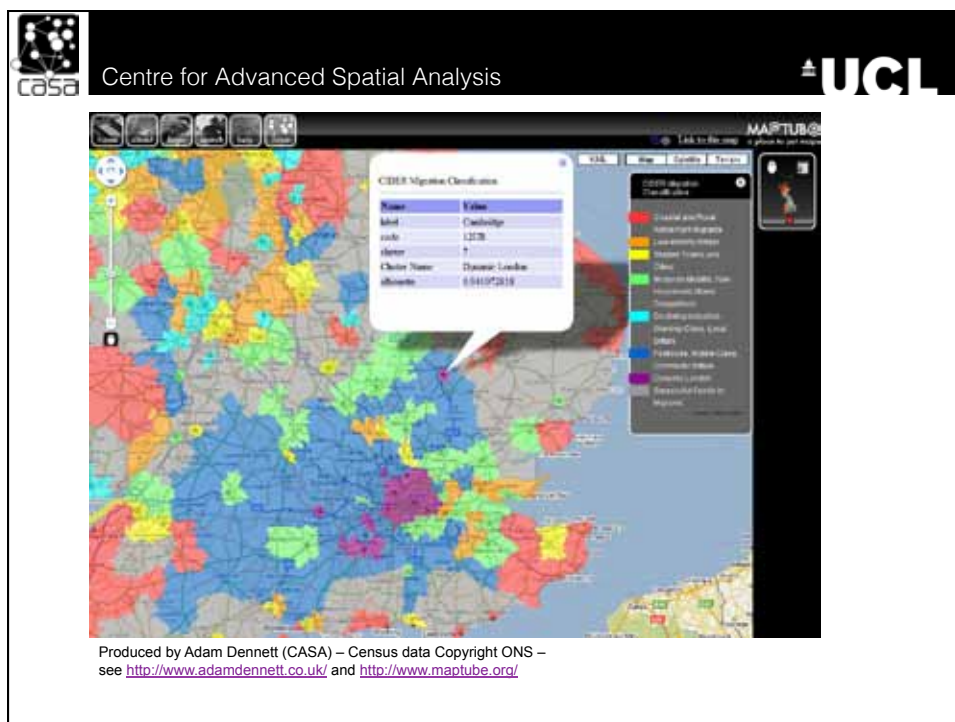

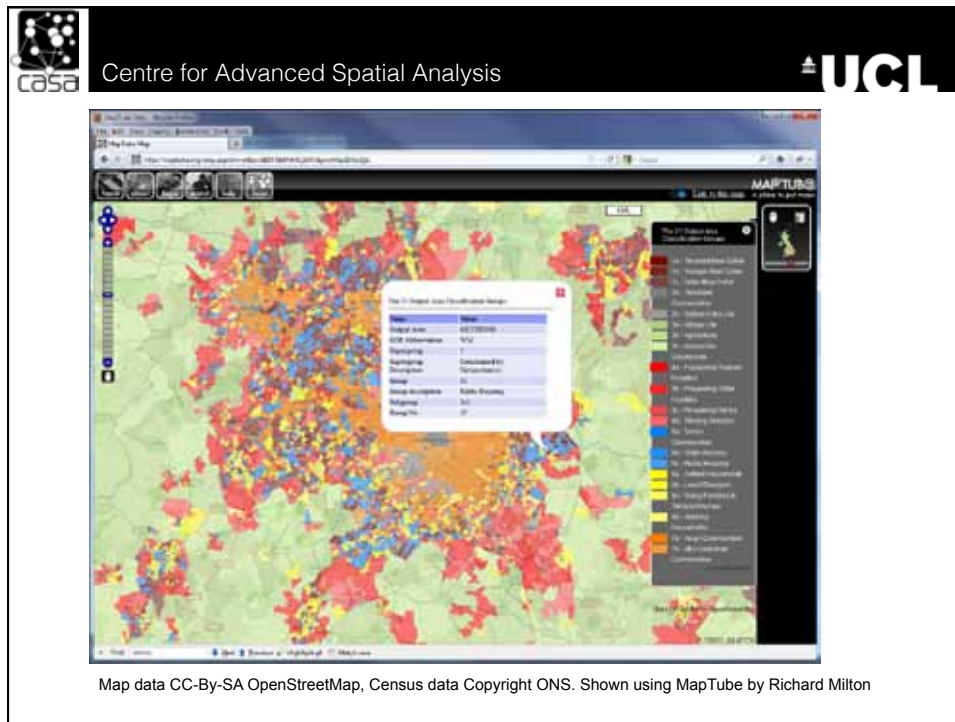

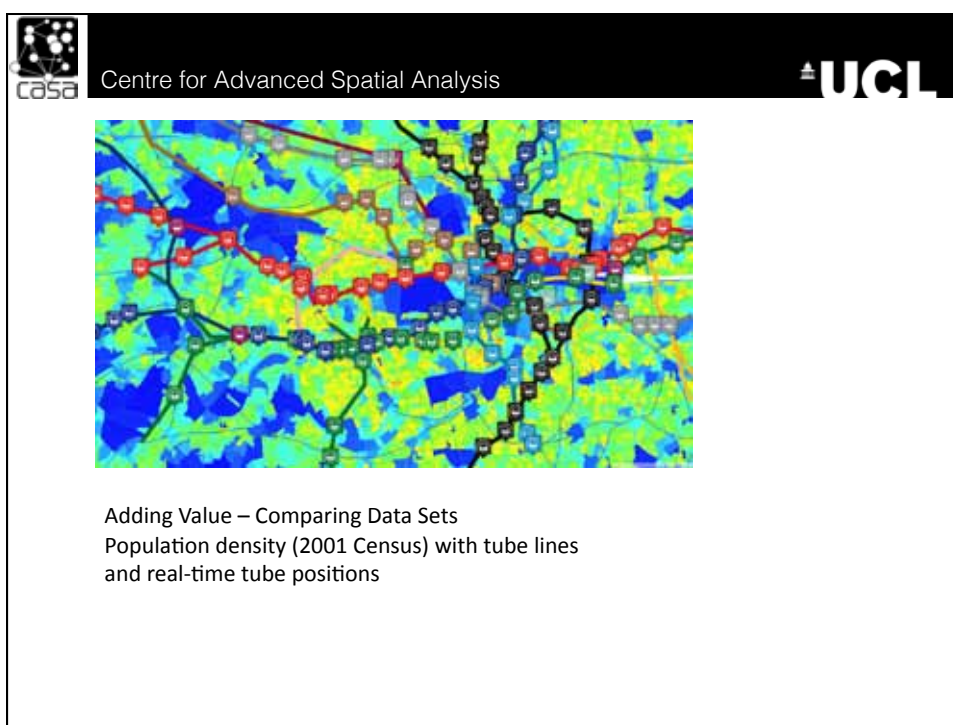

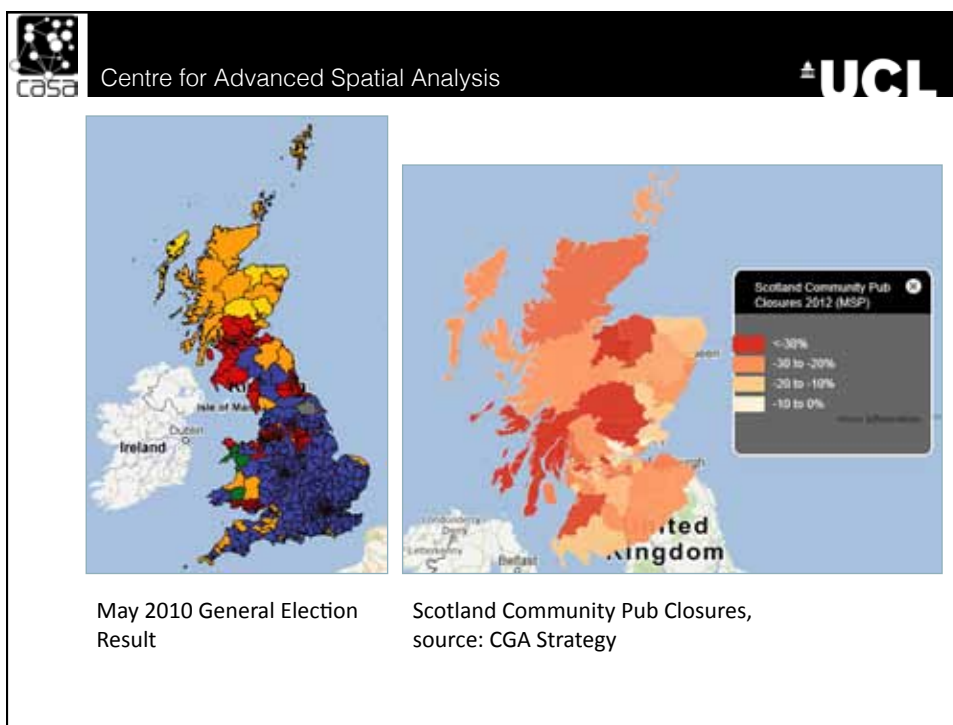

Centre for Advanced Spatial Analysis

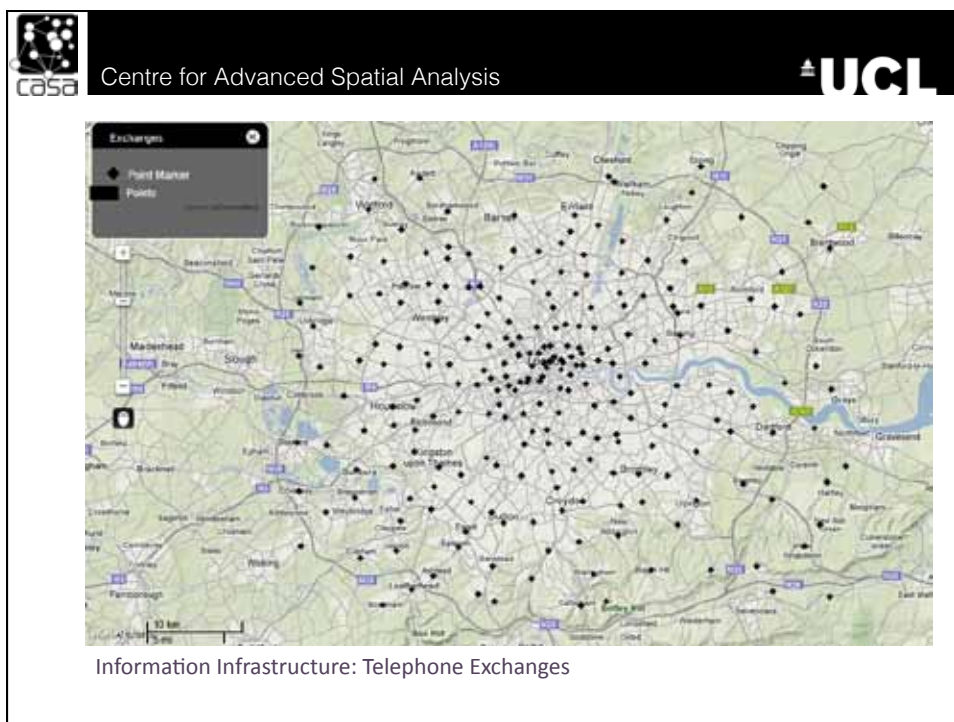

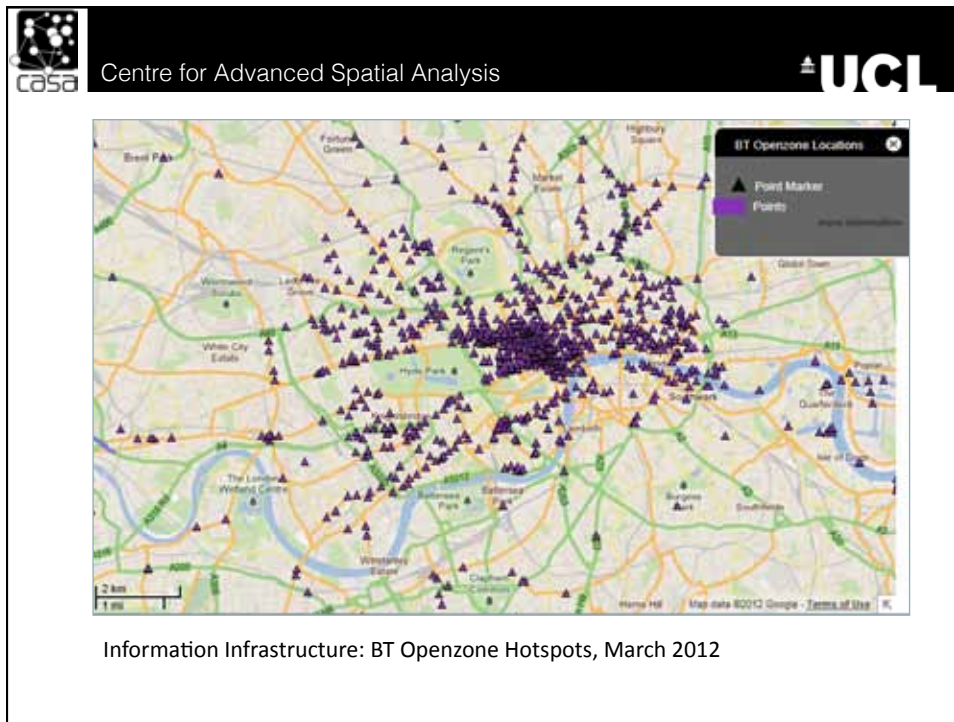

Web 2 and Online Mapping

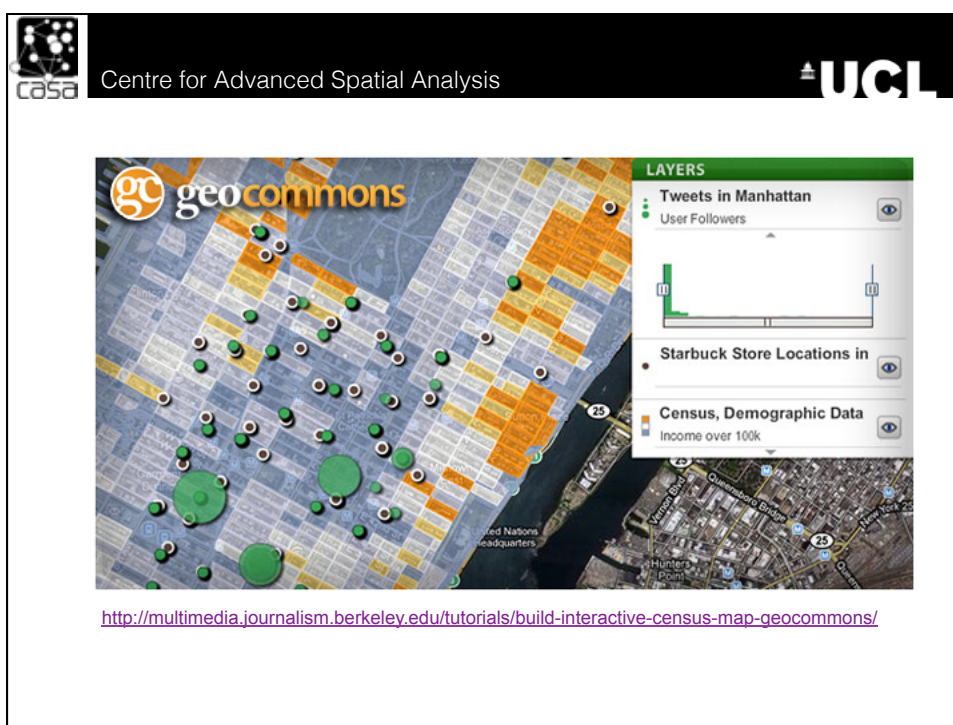

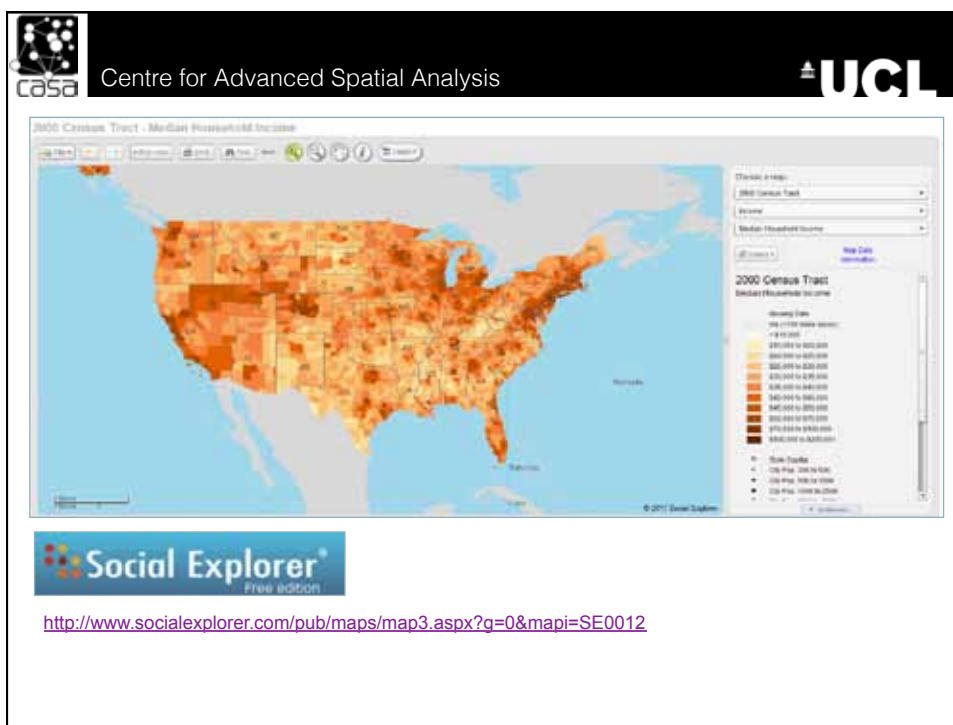

There are a whole variety of web sites now enabling you to explore maps based on various mashups. I will show some from the 2010 US Census stimulated by its release.

Our Census Profiler

Image-based
 Faster on the web browser
 Not delivering restricted data to the web browser

Open Source software
 Leverage the powerful
 OpenLayers mapping software
 More powerful than Google Maps equivalent
 An active development community
 Full access to the underlying code – greater flexibility

“Slippy” map
 Intuitive
 Encourages exploration

Integrating Diverse Data: Adding Value

Using our MapTube resource developed under DSR Genesis programme, we can now extract many open data

Centre for Advanced Spatial Analysis

Algorithm

Polygons

1. For the first N rows (N=10,000) of every column, use a RegEx test to rule out any columns that can't possibly match
2. For the first N rows (N=1,000) of the remaining columns, lookup key text in geocode database containing tuples of (key, dataset name) for every geography
3. Assign probability to column (prob, dataset) tuple based on number of matched rows

Points

1. Compute statistics on columns for: Min, Max, IsNumeric, IsProgression and Column Name Weight
2. Find X and Y Columns based on IsNumeric&!IsProgression
3. Choose CRS based on Min and Max

We are developing many new versions of MapTube that enable us to extract data from web sources

Centre for Advanced Spatial Analysis

Generating New and Complementary Data: Crowd-Sourcing

We will show some early work dating to the beginning of the credit crunch. But the classic example is Open Street Map, that we are proud to say has its origins in UCL, if not in CASA where Steve Coast was an intern – terrible word – in the late 1990s

To generate data through eliciting responses to questions or ideas via the web, one needs a good broadcast medium and this is essential – our entry into this domain was through the BBC who came to use, having seen MapTube and asked us to help them elicit responses to how people felt about the credit crunch

Centre for Advanced Spatial Analysis

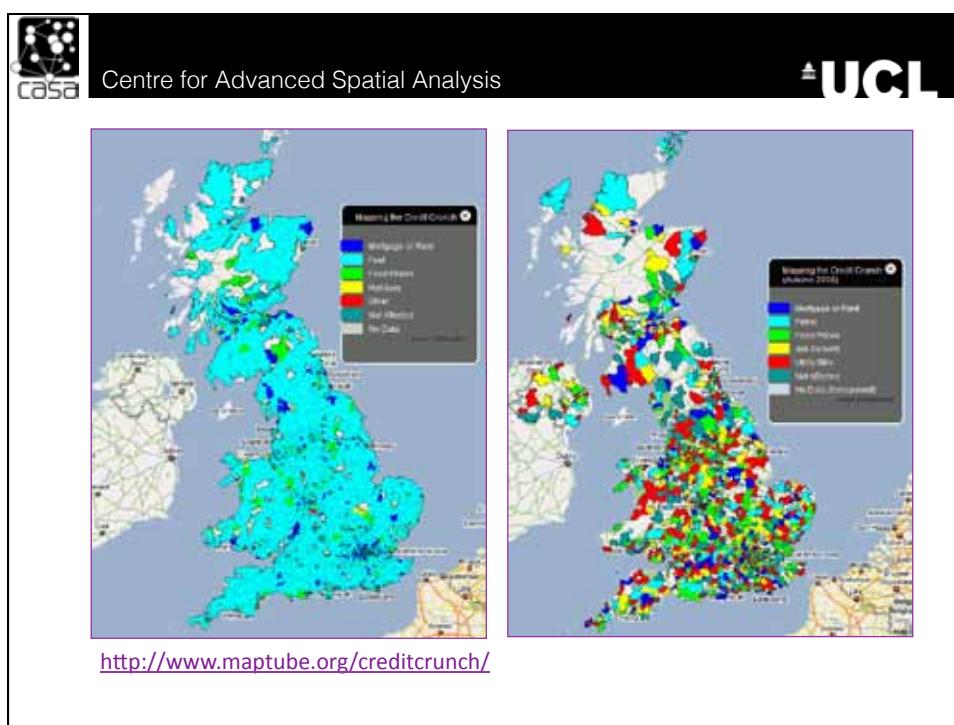

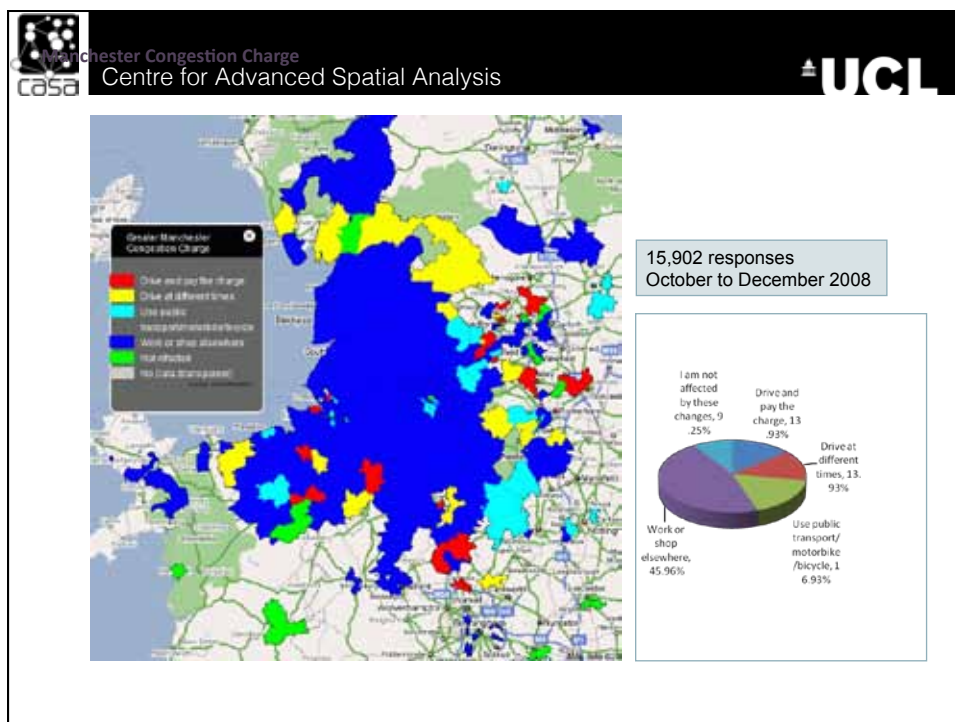

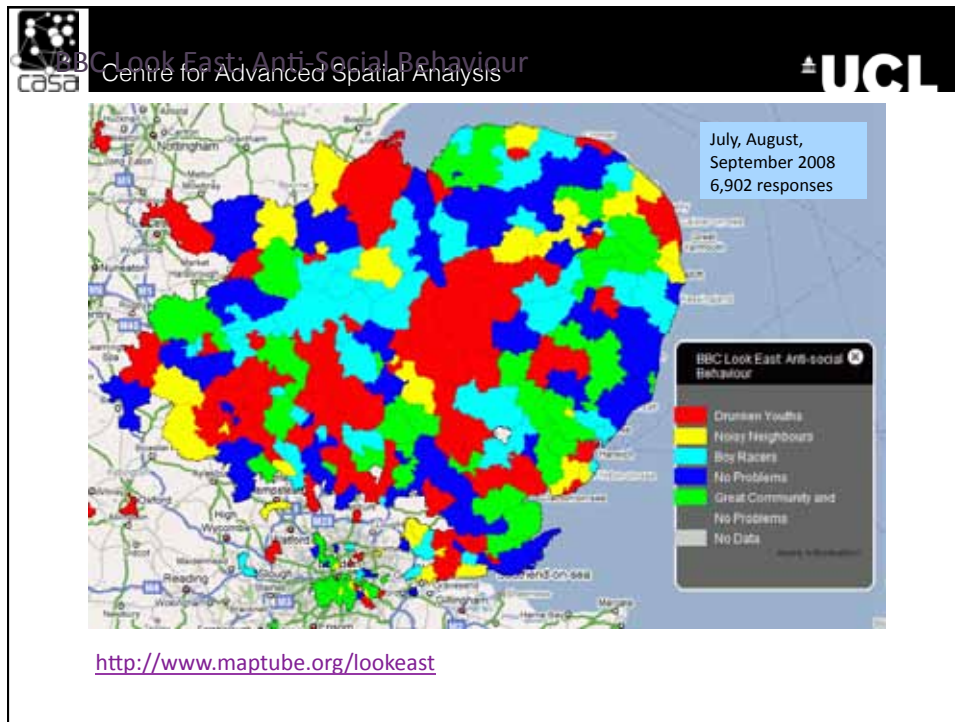

23,475 responses
April, May, June 2008

A new credit crunch survey started in October and currently has 3,802 responses.

Olympics Live Tweet Collection

We are collecting all geo-tagged tweets from the Olympics. Data for the period from the opening ceremony until the end of the Games is complete. This collection is being used to create a visualisation of the data and to provide a platform for analysis.

Real-time updates to this page will be reflected on this page. The total count will be reflected on this page. To see the data using WebGis, go to the top right and click the 'Visualise' button. (Full-screen mode is available in the top right corner.)

Visualising London's Tweets
3 Months – Jan to March 2011

Collecting social media using open APIs such as Twitter data; extracting meaning from such data such as spatial locations. The collection requires large storage (multi-server) capacity for routine analysis

CASA Centre for Advanced Spatial Analysis **UCL**

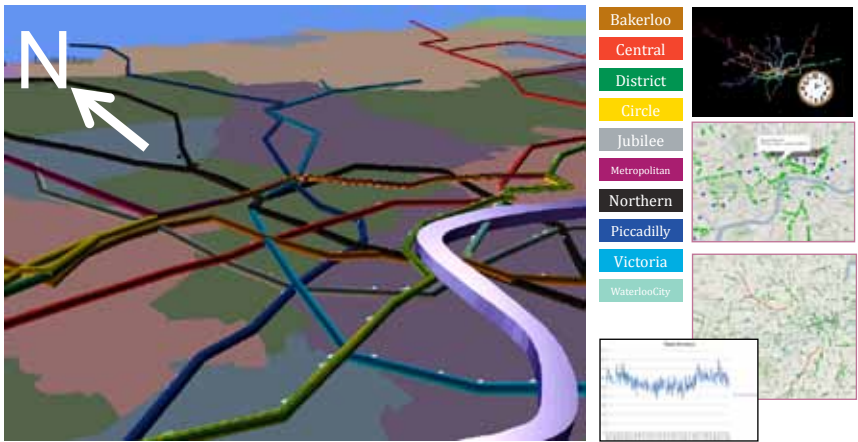

Visual Analytics

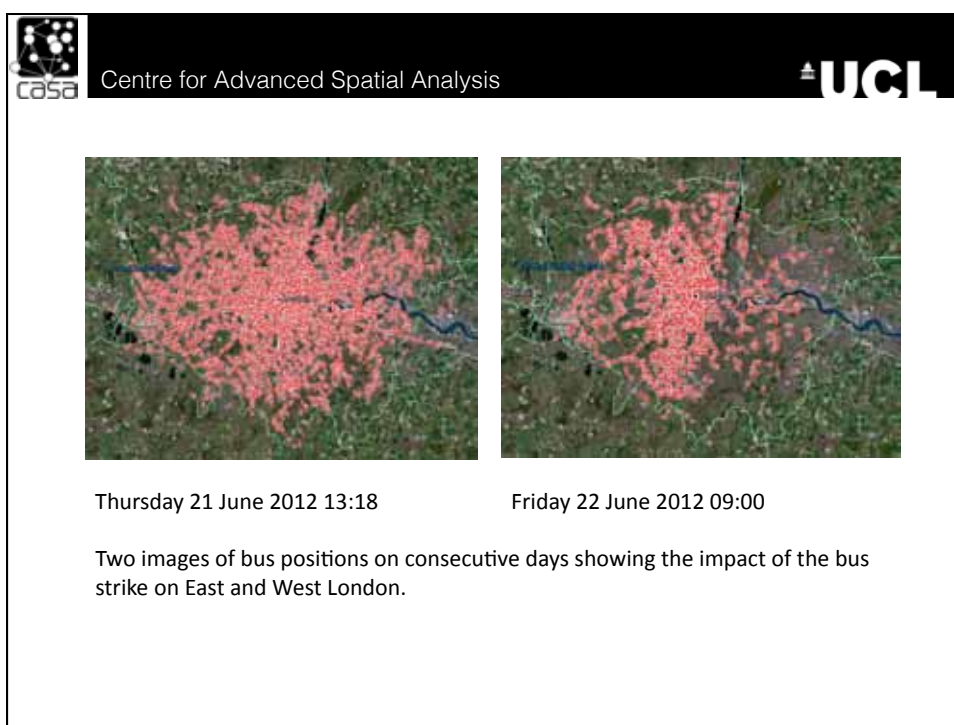

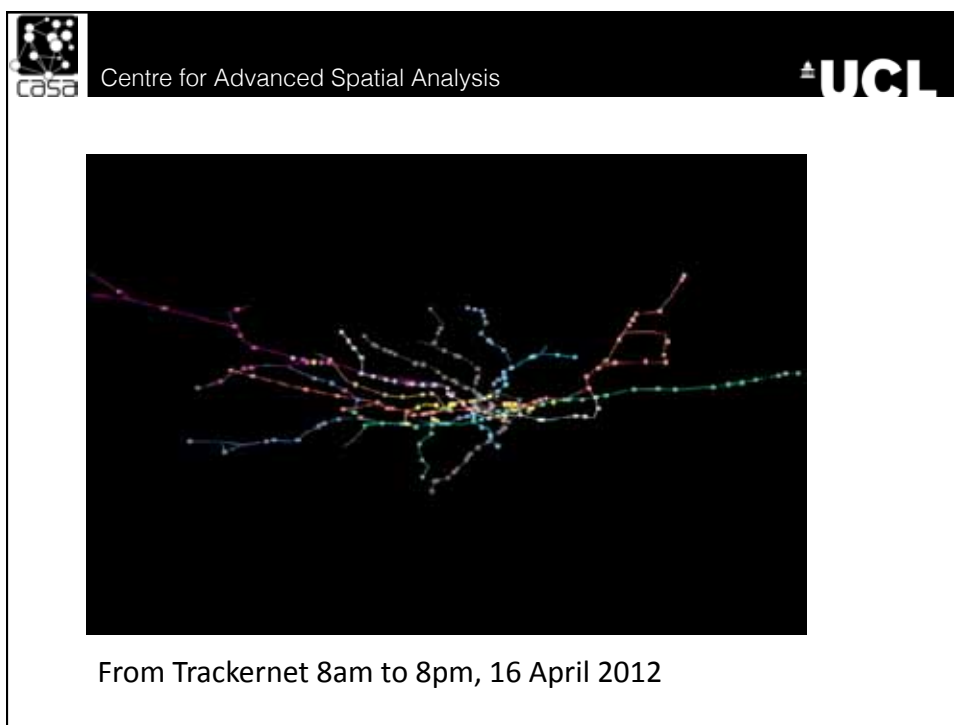

Collecting Oyster card, public transport flows, bike use etc from very large archives of open data (~ a billion records)

CASA Centre for Advanced Spatial Analysis **UCL**

Visual Analytics:

Visualising flows on networks from sampling and recording real-time movements

The figure consists of two side-by-side network graphs. The left graph shows a simple, branching structure with a few nodes and edges. The right graph shows a more complex, dense network with a central cluster of large nodes, representing high accessibility centrality. The nodes are represented by spheres of varying sizes, and the edges are represented by lines. The right graph has a central hub-and-spoke structure with many smaller nodes branching out from the center.
